OPENFUND

OPENFUND PROP

Executive Summary

Openfund Prop — pre-seed investment overview

USD 50–100K under evaluation

November 2026 · Confidential

2–3 pages · figures from the financial model

Executive Summary

Openfund Prop is a pre-seed proprietary-trading technology venture with a working, repository-verified MVP: a bilingual (English/Persian, RTL) trading terminal, server-authoritative simulated execution with a persistent ledger, portfolio analytics, a private trader journal, and a published challenge catalog rendered from a single source of truth. What is unbuilt is labelled unbuilt — payment activation, evaluation enforcement, funded accounts and payout processing are the funded next steps, stated plainly in the product's own checkout and Rulebook.

Business concept

A hybrid prop-trading platform: paid simulated challenges (Standard two-phase $44–$652; One-phase $74–$666; Instant $60–$888; Free Trial as a no-reward lead instrument) with contractual reward payouts on the funded stage, and — subject to legal validation — selective real-capital allocation to proven traders. Simulated performance, contractual rewards and real trading P&L are separated in product copy and accounting.

Market opportunity

Industry revenue is estimated at ~$850M in 2026, up from ~$130M in 2021, with ~12M challenge purchases per year across 120–150 firms (third-party analyst estimates; no authoritative dataset exists). The industry's trust deficit — the 2023 CFTC action against MyForexFunds and the 2024 MetaQuotes withdrawal — creates the opening for a transparent, platform-independent, bilingual operator. Openfund's published prices sit at/below the 100K two-step median ($538).

Product differentiation

Own Vela terminal (no MetaTrader dependency); radical status transparency; bilingual EN/FA with full RTL from day one; cost discipline (peak cash need $24.5K in Base). The trust posture is the brand.

Hybrid model

Evaluation ⟶ funded stage with contractual rewards ⟶ selective live capital (capped 10% pool, 2–4% of funded accounts, gated on legal opinion). The live component is an option, not the thesis; the model isolates it so the case stands with it at zero.

MVP status

Completed (repository evidence): terminal, execution engine, ledger, analytics, journal, wallet auth, CMS/catalog, CI and deployment blueprint. Planned (this round): payment, evaluation enforcement, funded accounts, payouts, trial provisioning, KYC/payout rails.

Proposed revenue model

One-time challenge fees net of promos and refunds; cohort-based payout liability (funded pool × participation × average payout) with the payout-to-revenue ratio as an output control (Base: ~48% over five years). Base-scenario revenue: $120K ⟶ $1.27M annually by year five; $3.32M cumulative.

Canadian establishment strategy

Federal (CBCA) incorporation planned — not yet incorporated. Verified costs: $200 incorporation (1 day), $12/year annual return, ~$2.3K/year compliance; combined small-business tax ~11.2%. Regulatory classification requires pre-launch securities counsel. The Start-up Visa Program is closed to new applications (since 2025-12-31; successor pilot announced, not launched) — immigration eligibility is separate from business viability.

Funding range

USD 50,000–100,000 under evaluation: Lean ($50K, sufficient in Base), Base ($75K, recommended buffer), Accelerated ($100K, faster cadence + live pilot). Use of funds: product/engineering 30%, marketing/acquisition 25%, operations 18%, compliance/establishment 12%, live-capital pilot 10%, contingency 5%. The Conservative scenario honestly shows a $242K shortfall at $50K — the model does not force a positive result.
